

**iXO Application:
Multiple Venues**

This application example for a large multiple venue campus utilizes 16 individual iXO systems. One system is located in Master Control, with the remaining 15 situated in various sporting and entertainment venues throughout the campus.

In the Master Control iXO system there are various audio sources (background & foreground music, page mics, message repeaters, etc.) available for playback throughout the entire campus. There are also multi-channel interfaces to the campus security communication system which allow live emergency paging to be routed to any output campus wide.

The remaining systems have plenty of local inputs for accommodating a wide variety of venue specific sources. Outputs feed the venue power amplifiers for sound reinforcement and interface to the local digital signage audio network. The system can be programmed so that any venue priority or emergency page can interrupt individual speaker zones, groups of, or all speaker zones.
